

Temporary Cessation of Mining Permit
Large Scale Mine Permit 006

RECEIVED
OCT 19 2022
MINERALS & MINING PROGRAM

Legal Description of Parcels of unreclaimed acres within the permit area concerning the temporary cessation activity:

Township	Range	Section	Owner	Acres
9	1	15	BLM	1.4

1. Plan for resumption of mining activities.

ACC requires further investigation and drilling to define the extent and quality of the material available to mine. The date mining will resume is unknown; mining will be re-initiated when supported by demand for the specific clay grade and associated economics. Mining would resume by following the existing approved mine and reclamation plan. If changes to the existing mine plan are necessary at that time, ACC will submit a miner permit amendment application or a new mine permit application for approval of any proposed modification.

A number of erosional features have been identified and are being monitored for stability. If necessary, ACC will stabilize the features by rerouting water, using diversion structures, or rock check dams.

2. Description of measures taken to comply with concurrent, interim, and final reclamation.

Majority of the disturbance that has taken place under this permit has been fully reclaimed through seeding. ACC proposes to continue to monitor revegetation areas until bond release or a determination is made on future mining. There is a single area that appear to be un-reclaimed disturbance located in 9-1-15. ACC proposes to leave the

areas as is, since the areas are stable and will consider additional reclamation should future development be pursued. Please see the photo below depicting the area.

Photo description:

Associated disturbance, looking east.

Where appropriate, ACC will use signs and fences to control access to the site. If unauthorized travel is observed, ACC will place signs indicating motorized travel is prohibited.

3. Measures taken to maintain the site include the

seeding that has already taken place, fencing the reclaimed area this spring, monitoring for erosion and spraying weeds as necessary.

Drainage and erosion

Majority of the site has been fully reclaimed through seeding including drainage reconstruction. Revegetation of the site is the primary erosion control measure. While vegetation is becoming established ACC will monitor the site in the second and third quarters of each year for development of erosion locations and seeding success. Reseeding will be completed on locations where seeding has failed or where ground disturbing activities are required to repair any erosion locations.

Debris – site conditions

There is no equipment or facilities remaining at the site. It is reclaimed to native prairie. No debris will collect at the site.

Petroleum products

All petroleum products and chemicals have been removed from the mine site.

Fire protection

ACC has no plans to maintain fire protection. The site is reclaimed to native prairie. We have no equipment, no facilities, and no human presence on site.

Equipment storage

No equipment or tools remain at the site. If maintenance is needed (e.g. erosion mitigation, re-seeding, fencing) the necessary equipment will be mobilized at that time.

Other measures

ACC has fenced many of the reclaimed site to protect the site from grazing the first few years after seeding. ACC will communicate with the BLM, who will also monitor the site for potential environmental damage.

Access Control

Private access is signed as per the preference of the surface landowner. On private areas with access, gates are placed in accordance with landowner consent. Active mining areas are signed warning the general public of mining equipment activities. At this time, no access features are proposed with temporary cessation.

Weeds

ACC will be monitoring the site the presence of noxious weeds. If noxious weeds are located, ACC will work with county weed and pest or private contractor to treat and control problem areas.

Containment Liner Systems

Not applicable.

Process ponds

Not applicable.

Fire protection

ACC will maintain haul roads and access features to provide fire breaks and ability of emergency response to wildland fires.

Processing systems

Not applicable.

Water monitoring

ACC maintains a stormwater permit authorized through the Water Protection Bureau. No additional monitoring is required at the site.

4. Existing condition of affected land.

Majority of the land is reclaimed land. The surface is stable and blended into the existing land area, which is a mix of pre-law, AML, and reclamation areas, both bond release and bonded areas.

Majority of the land is reclaimed land. A small portion has been identified as unreclaimed land. This unreclaimed (associated disturbance) portion appears to be a highwall left as the embankment to a pond (see photo above). It's unclear if this area was seeded, however it appears to be stable and native vegetation is established in pockets. ACC proposes to continue to monitor this area for stability and make a determination on further reclamation in conjunction with future development investigation.

5. Proof of Consultation with Surface Owner.

See enclosed the certified return receipts.
